

Height Improvement Routine (Posture + Spinal Alignment)

This daily routine focuses on spinal decompression, posture correction, and flexibility — three key areas that can help you look and stand taller. While bone growth is limited after 18, consistent training can improve your posture and add 2–5 cm of visible height.

1■■ Spinal Decompression

Goal: Stretch and relieve spinal pressure.

- Hanging from a bar — 3 sets × 30–45s
- Cobra Stretch (Bhujangasana) — 3×30s
- Cat–Cow Stretch — 2×10 slow reps

2■■ Posture & Core Alignment

Goal: Strengthen muscles that hold your spine upright.

- Plank — 3×40s
- Superman Hold — 3×30s
- Wall Angels — 3×12 slow reps
- Chin Tucks — 3×10 (hold each 5s)

3■■ Lower Body & Hip Flexibility

Goal: Loosen tight hips and lengthen the lower spine.

- Lunges with Stretch — 3×10/leg
- Seated Toe Touch — 2×30s
- Standing Quad Stretch — 2×30s/leg
- Bridge Pose (Glute Bridge) — 3×15

4■■ Bonus Habits

- Sleep 7–9 hours — your spine decompresses during rest.
- Drink 2–3 L of water daily — spinal discs need hydration.
- Maintain good posture — chin up, shoulders back, chest slightly forward.
- Swimming or hanging sports — natural spinal elongation.

■ Do this routine daily for 15–20 minutes. Within 4–6 weeks, you'll notice improved posture, less slouching, and a taller, more confident stance.
